The Morningstar ETF Asset Allocation Portfolio Series are not exchange-traded funds (ETFs), instead, they consist of five risk-based asset allocation portfolios that invest in underlying ETFs, which are typically open-end investment companies or unit investment trusts.

The Portfolio allocates investments among multiple ETF asset classes including: US equity, fixed income, real estate and international ETFs. Asset allocation does not assure a profit or protect

against down markets. The stocks of smaller companies are subject to above-average market price fluctuations. There are specific risks associated with international investing, such as currency fluctuations, foreign taxation, differences in financial reporting practices and rapid changes in political and economic conditions. Real estate investments are subject to specific risks, such as risks related to general and local economic conditions and risks related to individual properties. Fixed income securities are subject to interest rate risk, prepayment risk and market risk. Commodity trading is highly speculative and involves a high degree of risk.
